

thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar.

PARAGRAPH 8

Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar. Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar.

PARAGRAPH 9

Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar. Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar.

PARAGRAPH 10

Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar. Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar.

PARAGRAPH 11

Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar. Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar.

PARAGRAPH 12

Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar. Photosynthesis converts light energy into chemical energy stored as glucose. The light-dependent reactions occur in the thylakoid membrane and produce ATP and NADPH. The Calvin cycle occurs in the stroma and fixes carbon dioxide into sugar.
